CSCD01 Best Group

We are CSCD01BestGroup, a highly motivated team of students with industry experience in multiple fields of computer science. Our team shines because of our individualism; no member is alike and we each bring different strengths to the team to create a working environment that is greater than the sum of it's parts. We all have a thorough understanding of programming techniques and methods through our experiences as both students and professionals. Working in the industry has taught all of us valuable lessons in working with large codebases and in the Agile development methodologies.

Our team's biggest goal during this project is to get our changes committed to the main project branch as we would love the achievement of having many people worldwide using something we had created. From working on his goal, we aim to gain a better understanding of the software development and contribution process so we can apply it to our own future projects.

Brendan Zhang is a fourth year student at the University of Toronto Scarborough, majoring in Computer Science and has worked as an Application Developer at DAC Group. With a passion for learning and creating quality software, Brendan has experience creating web applications, designing databases and using large data sets with novel machine learning algorithms to create interesting applications. Brendan has experience using C, C++, C#, JavaScript, Java, .NET, and various other technologies but believes in using the best tool for the task. In his free time, he likes to play basketball and work on side projects to keep his technical skills up to date.

Lioudmila (Lucy) Tishkina is a fourth year Computer Science student pursuing a specialist in Software Engineering at UTSC. During her studies she has developed proficiency in the Python, Java and C programming languages. Through her co-op work terms, she has added web development languages and frameworks such as AngularJS, HTML, CSS, jQuery and JavaScript to her knowledgebase. Her experiences in software engineering has challenged her to develop her technical abilities as well as improving her communication, teamwork and organizational skills. She is confident in her abilities in all aspects of the software development process including testing, development, documentation and debugging. She looks forward to contributing her strengths and abilities to her team.

Bolaji Fatade is a fourth year Computer Science student at the University of Toronto, Scarborough currently specializing in the Software Engineering stream with minors in French and Economics. He would describe himself as a strong engineer with a knack for entrepreneurship. Bolaji has been writing code since he was 12 years old and has developed many skills and gained lots of experience along the way. Some skills include deep knowledge of Python, Java, C, Javascript as well as Android and iOS development using Swift but he's a willing learner and is ready to use whatever tool is right for the job. He's particularly interested in compilers, Cloud Computing and deep learning. He interned on the Internal Tools team at Dimension Data in the summer of 2015 and he decided in the summer of 2017 to feed his entrepreneurial spirit by joining a young startup called Resus Technologies in Pittsburgh, Pennsylvania. There he was part of a small engineering team that developed mobile and web software used by thousands of customers. While he was there, Resus Technologies was also accepted into the prestigious Alphalab startup accelerator. He has also attended many hackathons and was the winner of the UTSC Finance Hackathon in 2016 which led to a spot at The Hub, UTSC's startup accelerator.

BojOnTheBeat

Osarumwense is a third year Computer Science co-op student at the University of Toronto Scarborough. He has been programming for over four years and can program proficiently in Java, C, Python, and Javascript. Outside of school projects and assignments, he works on his programming skills by working on personal projects, competing at hackathons with friends, and does personal study and development. Some skills and attributes which he possesses and has demonstrated over the years include problem-solving, creative thinking, the ability to learn quickly, enthusiasm for work, learning new things, and a strong work ethic. These skills have helped him succeed in school, in his personal endeavors, as well as in the workplace. In the past year, he feels privileged to have been able to apply his knowledge and skills at many companies. He recently worked at CIBC in their technology solutions department as an Innovation Engineer at the company's Skunkworks Innovation lab. More recently, he worked at Index Exchange, an ad-tech software, and infrastructure company. In both roles, he was able to use and develop his skills while working in a development team to produce new features for the company's clients. He is always open to new and interesting challenges, learning new concepts and new technologies.

Silviu studies computer science at the University of Toronto. He is proficient at writing code in Python, Java and C. He has also written code in C++, JavaScript and bash. He can work independently and is a quick learner. He has excellent written and verbal communication skills. He enjoys collaborating with others to develop high quality code. Silviu has worked in Windows and Linux and is familiar with version control systems. He is experienced at writing applications using Google's native Android API. He has written applications that use SQL for data storage. He has a solid understanding of the principles of computer architecture and operating system design. He is interested in continuing to learn about good UI design, machine learning techniques, and mobile development. Silviu looks forward to further developing his skills as a computer programmer.

Shifeng Jin is currently in his third year of Computer Science Co-op Specialist Program at University of Toronto Scarborough. As he specializes in Software Engineering, he has been trained with the Agile project development model, and he has been through several dedicated courses where he developed understanding on how to program with Java, python, C, SQL, as well as algorithm and data structures. He has a year of work experience within a IT department at the Ministry of Health, where he built his skill set on web technologies including Nginx, Node.js, Angular.js, React.js and API management, and experienced some of the best practices on how to operate with Dockers and Cloud Foundry Platform. Additionally, during his work period he followed a web application project team from the development phase into the production phase, where he was meticulous in his work, cooperative in his team, and productive in troubleshooting deployment related issues.

Adnan is a fourth year Computer Science specialist at the University of Toronto in the Software Engineering stream. He has experience in C, Java and Python as well as HTML, CSS and Javascript. Previous projects he has worked on includes a mobile application to locate basketball courts in Toronto, which included the ability to view availability at each court and set up basketball games with other users which was developed using the MEAN stack for an Intro to Software Engineering course. Furthermore, he has completed internships at the University of Toronto and Caseware International Inc. At the University of Toronto, he worked as a User Experience Designer/Developer; taking part in the development of a timetable builder and a GPA calculator. Aside from development, he was involved in constructing usability tests for prototypes with students to understand what features were important for the applications, considerations on how to make the applications accessible and collaborating with a full time UX developer to design applications using the information collected. At Caseware, he worked as a Test Developer to maintain old and write new API performance tests for a Caseware Cloud application, do regression tests with older builds and analyze those results along with a full-time test developer to report to senior developers. Additionally, he worked on an internal test reporting site which displayed test results for various products. He brings previous development experience while working in a group dynamic and believes that, with his skills, he will prove to be useful in helping the team achieve their goals.

Charles is a fourth year Computer Science student specializing in Software Engineering, at the University of Toronto Scarborough. He has experience in back-end development from his time as a programmer analyst working at CI Investments. There he learned how to create software to meet the demands of the business where the requests aren't always clear. He also has experience in quality assurance from his time as a test developer working at Caseware Inc. This experience taught him how to elevate an already functional piece of software to something greater. Working in both sides of software development has taught Charles to be creative in coming up with solutions and ensure that those creative solutions provide the best result possible. Charles believes that a common goal is an essential component to a great team, and does his best to keep everyone on the same page.

Defining Doneness – Feature

- All associated code and documentation must be peer reviewed by at least one other group member.
- Code and documentation must follow style guide set forth by mathplotlib.
- Code must be put through regression testing to ensure it is compatible with the entire codebase.
- Release notes must be created explaining in detail what was changed and the reasoning behind the changes.
- All code must compile without warnings to establish a high level of quality.
- All newly created code must come with a set of unit tests.
- All relevant documentation must be updated if the modified code requires it.

Defining Doneness – Deliverable

- A deliverable will be considered complete if it meets all report requirements.
- The formatting must be correct and consistent with previous work.
- The contents of the deliverable will be reviewed by all team members to check for grammar, spelling, and content errors.
